## Interstitial sites in CP Structures

A large number of ionic structures can be regarded as built of CP layers of anions with the cations placed in interstitial sites

## for every anion, there is 1 Octahedral site and 2 Tetrahedral sites

Fig. 7.7 Interstitial sites in a c.p. structure. Heavy circles are above and the dashed circles below the plane of the paper: (a) $\mathrm{T}_{+}$site, (b) $\mathrm{T}_{-}$site, (c) O site

## Ionic Crystal Structures

Many ionic crystals consist of a close-packed lattice of the larger anions with the smaller cations occupying interstitial sites.

## Fluorite $\left(\mathrm{CaF}_{2}\right)$ and Antifluorite $\left(\mathrm{Li}_{2} \mathrm{O}\right)$

- origin of the term "fluorescence" (George Stokes, 1852)
- fluorite common for fluorides of large, divalent cations and oxides of large tetravalent cations $\left(\mathrm{M}^{2+} \mathrm{F}_{2}\right.$ and $\left.\mathrm{M}^{4+} \mathrm{O}_{2}\right)$
- antifluorite common for oxides/chalcogenides of alkali earths $\left(\mathrm{M}_{2} \mathrm{O}\right)$

## Self Test

Identify the following crystal structures:

[^0]:    *The h.c.p. oxide layers in rutile and $\gamma-\mathrm{Li}_{3} \mathrm{PO}_{4}$ are not planar but are buckled. The oxide ion arrangement in these may alternatively be described as tetragonal packed (t.p.).

[^1]:    ${ }^{a}$ Lattice constants are values at room temperature.
