# MO Diagrams for Diatomic Molecules

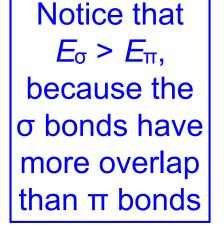

Chapter 5

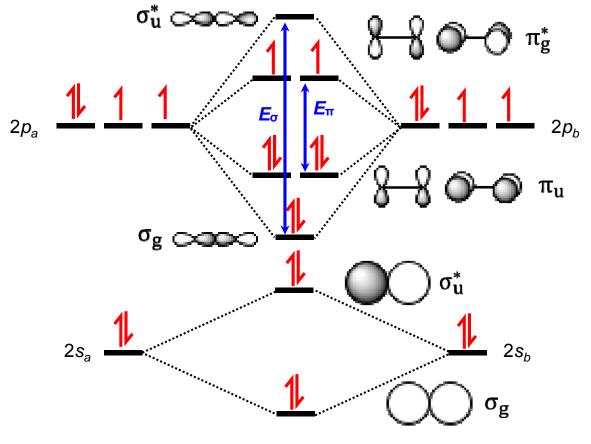

Friday, October 9, 2015

# **Homonuclear Diatomic Molecules**

What happens when we move to more complicated systems? Consider O<sub>2</sub>.

- We can use LCAO-MO theory to get a better picture:

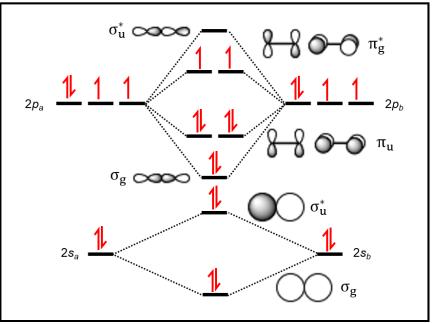

# **Electron Configurations and Bond Orders**

Just as with atoms, we can write a molecular electron configuration for O<sub>2</sub>

 $\sigma^2\sigma^{*2}\sigma^2\pi^4\pi^{*2}$ 

We can also calculate the O–O bond order:

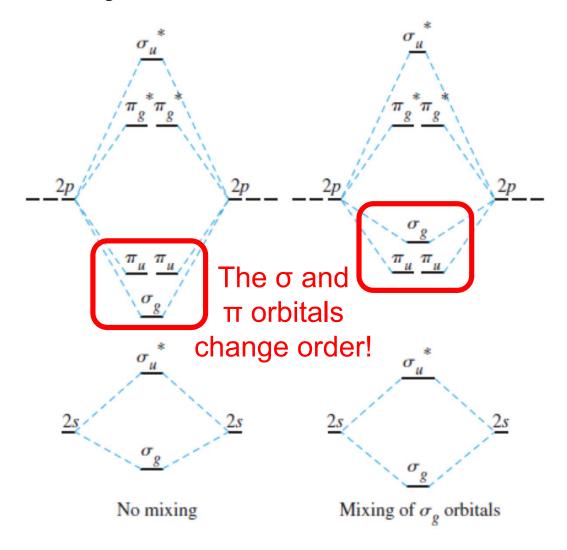

$$BO = \frac{1}{2} [(\# \text{ bonding e}) - (\# \text{ anti-bonding e})]$$
$$= \frac{1}{2} [8 - 4] = 2$$

LCAO MO theory also predicts (correctly) that O<sub>2</sub> has two unpaired electrons.

## **Orbital Mixing**

Orbitals of similar but unequal energies can interact if they have the same symmetry

The 2s and 2 $p_z$  orbitals form MOs with the same symmetry ( $\sigma_g$  and  $\sigma_u$ ). sp mixing causes the  $\sigma_g$  and  $\sigma_u$  MOs to be pushed apart in energy:

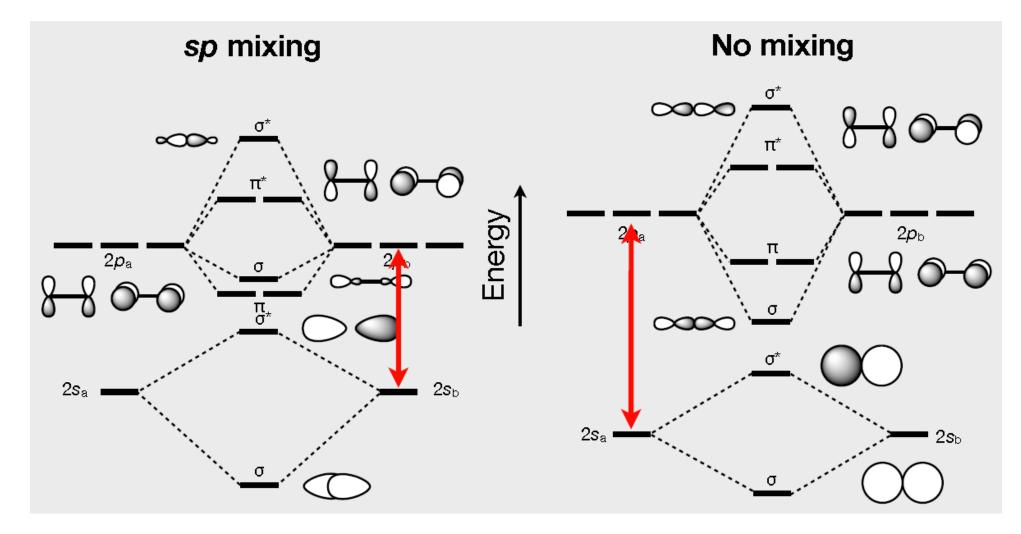

#### **Orbital Mixing**

The size of the effect depends on the 2s-2p energy difference.

 $\sigma_{u}^{*}(2p)$  - $\pi_{g}^{*}(2p)$ ↑↓  $\sigma_{\mu}^{*}(2p)$ <u>↑</u> <u>↑</u> <u>1↓ 1↓</u>  $\underline{\uparrow} \underline{\uparrow} \underline{\uparrow} \pi_g^*(2p)$  $\sigma_g(2p)$  order changes  $\pi_{\mu}(2p) - -$ 1 1 <u>∩↓</u> <u>↑↓</u> ↑↓ <u>∿ ∿</u>  $\sigma_{u}^{*}(2s)$  \_\_\_\_\_\_ <u>∿ ∿</u> <u>∿ ∿</u> ∿ ∱↓ 1↓ 1↓  $\pi_u(2p)$  $\sigma_g(2s) \stackrel{\uparrow \downarrow}{=}$ ∱↓ ∜ ∿∤  $\sigma_g(2p)$ ∱↓ ₩ ∱↓ ₩ ₩ ∜ ∱↓ ∱↓ ₩ small  $Z_{\rm eff}$  = large  $Z_{\rm eff}$  = ∿  $\sigma_{\mu}^{*}(2s)$ small energy large energy ∿ <u>↑↓</u> Ne<sub>2</sub>  $\sigma_g(2s)$ difference = difference = Lia Be2 B<sub>2</sub> C22 F<sub>2</sub> N<sub>2</sub> 3 02 2 0 Bond order 0 small sp mixing large *sp* mixing 0 0 2 0 Unpaired e 0 0 2 0

# **MOs of Homonuclear Diatomic Molecules**

The MO picture of homonuclear diatomic molecules depends on the amount of *sp* mixing.

 $Li_{2},\,Be_{2},\,B_{2},\,C_{2},\,N_{2}$ 

O<sub>2</sub>, F<sub>2</sub>, Ne<sub>2</sub>

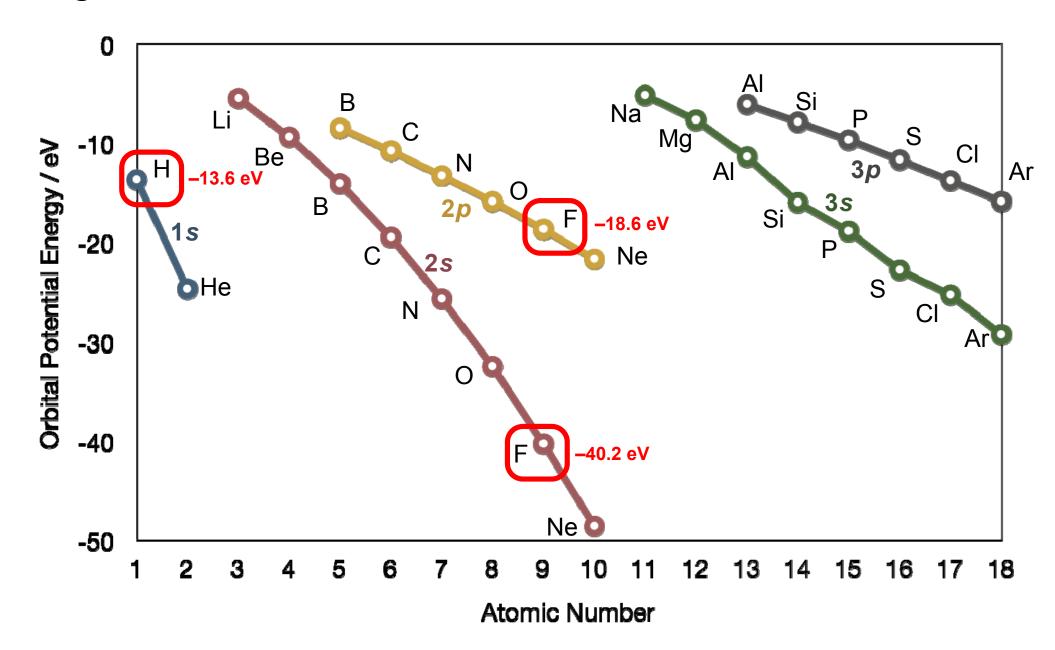

#### **Bond Order and Bond Distance**

The MO bond order is the main factor controlling the internucelar distance.

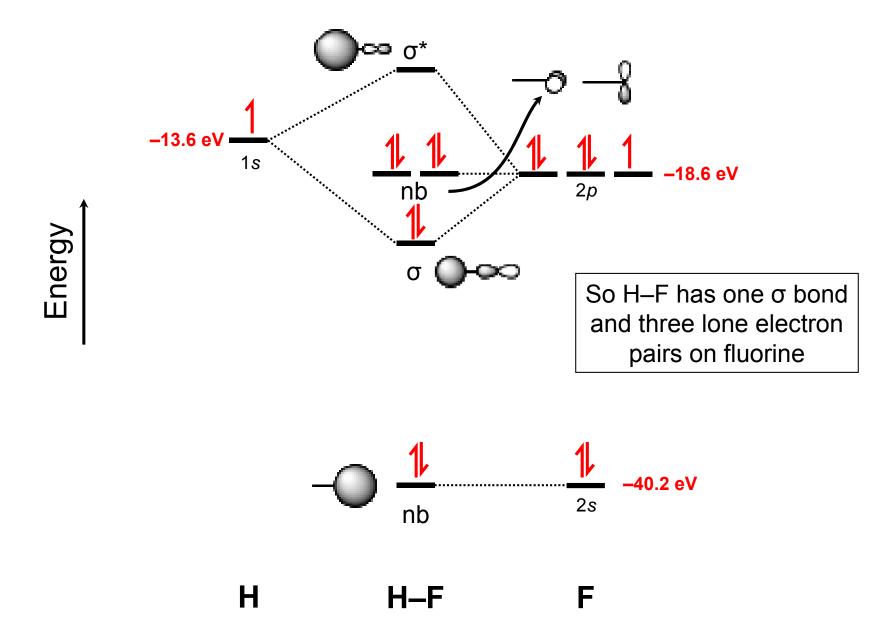

### **Relative AO Energies for MO Diagrams**

*Photoelectron spectroscopy* gives us a pretty good idea of the relative energies for AOs.

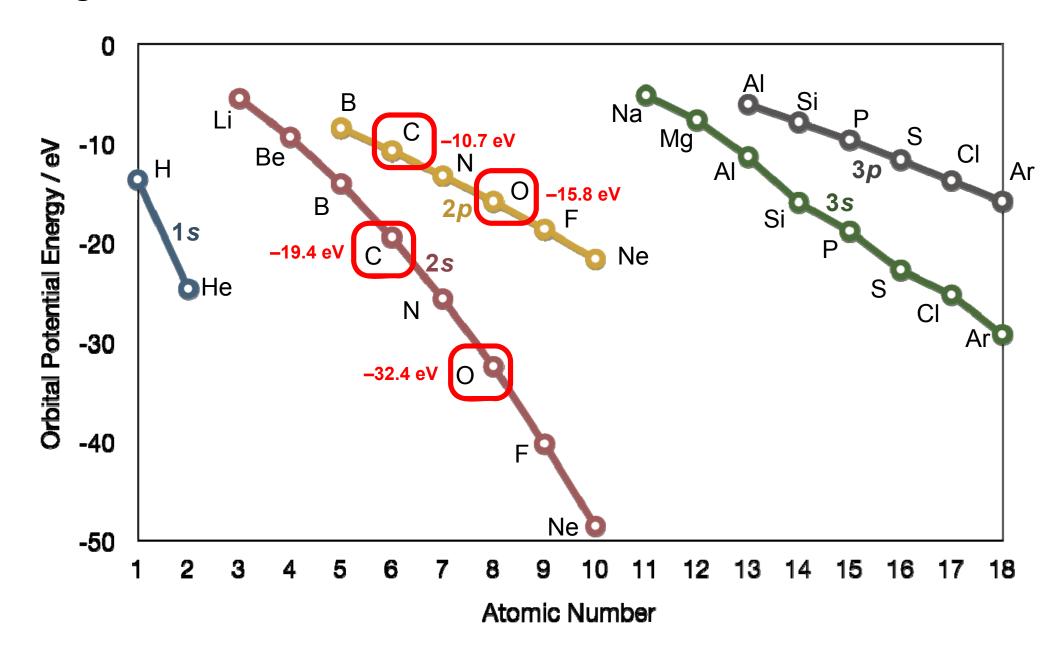

## **MO Diagram for HF**

The AO energies suggest that the 1*s* orbital of hydrogen interacts mostly with a 2*p* orbital of fluorine. The F 2*s* is nonbonding.

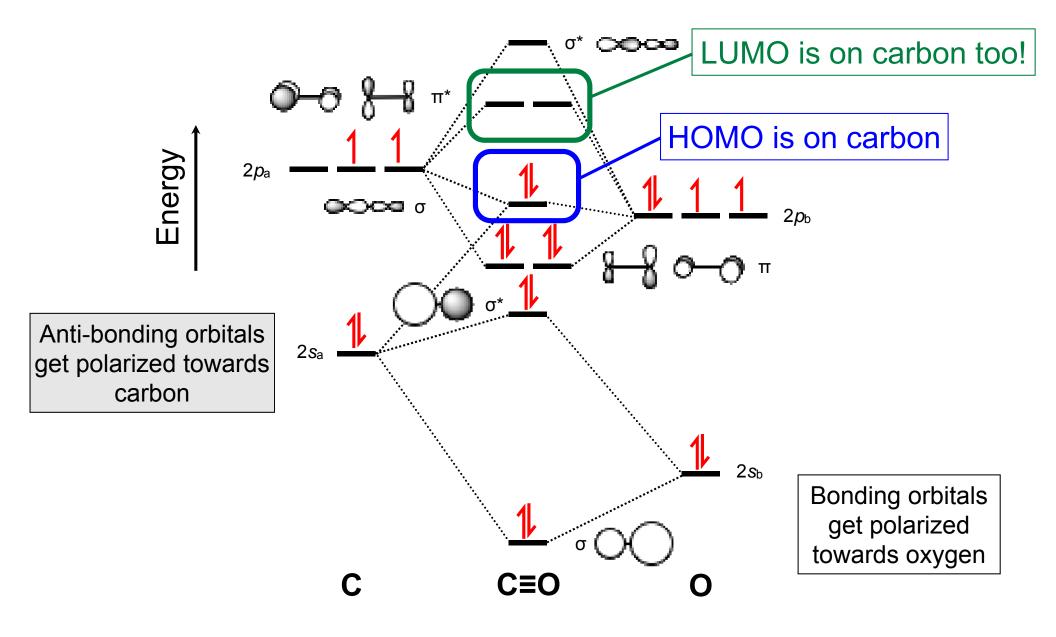

### **Relative AO Energies for MO Diagrams**

*Photoelectron spectroscopy* gives us a pretty good idea of the relative energies for AOs.

#### Heteronuclear Diatomic Molecules: CO

In molecules with more than one type of atom, MOs are formed from AOs that have different energies. Consider CO:

# Summary

#### **MO** Theory

- LCAO-MO Theory is a simple method for predicting the approximate electronic structure of molecules.
- Atomic orbitals must have the proper symmetry and energy to interact and form molecular orbitals.
- Photoelectron spectroscopy provides useful information on the energies of atomic orbitals.
- Next we'll see that symmetry will help us treat larger molecules in the LCAO-MO theory framework.
